

Sixdof Space has created an optical tracking solution offering precision landing with cm level accuracy both indoors and outdoors in direct sunlight. Our patented technology leverages infrared lighting to serve as location beacons. Our sensor unit, connected to your drone or robot, can see the beacons on the ground (or opposite the sensor; currently tested up to 100 meters). Our algorithms will report the 6DOF positional data to the drone/robot, to direct an autonomous landing, docking or relative position.
